Remarks to Purchasers
READ CAREFULLY BEFORE ORDERING

Name and Address. Write your Name, Post Office, County and State as distinctly as possible. Some orders reach us which give neither name nor location. In such cases it is impossible for us to fill orders until we again hear from the senders.

Use the Order Sheet. Make out your list of requirements consecutively in the order as given in the Catalogue, placing the quantity wanted before the article, and the price of the same in the column to the right; and always keep a copy of your orders.

Correspondence should not be intermingled with the body of the order, but written either at the bottom of the Order Sheet or on a separate sheet of paper.

Remittances. The safest method of sending money is by Post-Office Orders. Where they are not obtainable, it can be sent by Express Money Orders, Registered Letter, or Draft on New York. For small amounts, postage stamps will be acceptable.

When the Remittance is not sufficient to pay for the quantity of seeds ordered, we will reduce the quantity to correspond with the remittance.

Errors. All possible precautions are taken to avoid their occurrence. Notify us at once if your order is not properly filled, and we will promptly make the necessary corrections.

Substitutions. As the season advances some stocks of seeds are exhausted, so it is advisable when late orders are sent to name a few substitutes. We make substitution only when requested to do so, sending varieties that will as fully cover the indicated wants as our stock will permit. If not so instructed, the remittance will be refunded.

Send us Your Order as Early as Possible. It will facilitate its prompt execution, and you will have your seed when you are ready to plant.

Parcel Post. Seeds and bulbs can now be sent by parcel post at the same rates as general merchandise. See inclosed table of parcel-post rates for all zones.

Express Rates. Seeds, bulbs and plants are now entitled to special rates, which are considerably lower than rates on general merchandise. Where quick delivery is desired, we advise, unless goods are too bulky, to have shipments go forward by express.

Shipments by Freight. Seeds in bulk, implements and other heavy goods are shipped by freight, and unless there is a freight agent at point of destination, the freight must be prepaid, the purchaser advancing the same, unless otherwise arranged. Our facilities for shipping to points south of Pittsburgh on the Ohio River and connecting streams are excellent, steamers plying daily between this and southern points.

Catalogues are sent free to all our customers of the past year. Should any change their place of residence, we desire to be informed, that we may correct the address in our Catalogue list. Our local customers, who purchase over our counters, will please give their correct address when making their first annual purchase; this will insure their receiving Catalogues the following year by mail. Many of our patrons who desire our Catalogues fail to receive them because their post-office address is unknown to us.

Non-Warranty. We do not warrant in any way, expressed or implied, the contents or description, quality, productiveness, or any other matter of any seeds, bulbs or plants sold by us, and we will not be in any way responsible for the crop. If the purchaser does not accept goods on the above terms, no sale is made thereof, and he must return them at once and money will be refunded. We make all sales subject to the above conditions.

BUCH BEAN CROP
LARGELY A FAILURE

BEANS (Bulb)

Beans should not be planted before the ground becomes light and warm, in favorable seasons usually about the first of May. The soil should be rich and mellow, and the seeds scattered about 3 inches apart in drills 2 to 2½ feet apart and covered about 1 inch deep. Successive sowings, made at intervals of about two weeks until the middle of July, will give a plentiful supply of Beans throughout the season. One quart of seed will sow 100 feet of drill.

WAXY or YELLOW-PODDED BUSH BEANS

The beautiful, rich yellow, semi-round pods are 7 to 7½ inches long and over ½ inch wide. It is early, hardy, stringless, rust-proof, of finest quality, and will sell on sight. Pkt. 10 cts., qt. 25 cts., qt. 50 cts.

BUSH LIMA BEANS

GIANT IMPROVED BUSH LIMA. This is superior to any of the older forms of Bush Lima. Plant, very vigorous and upright, attaining a height of 30 inches and 24 inches across. Pods often borne in clusters of five to eight and of enormous size. Beans are larger than those of any other variety and of the very best quality. Matures earlier than others; immensely productive. Pkt. 10 cts., pt. 25 cts., qt. 50 cts., 1/2 pk. $1.75, pk. $3.25.

QUARTER-CENTURY, or WONDER BUSH. Stalks large, bushy and vigorous, 18 to 20 inches high and as much across; yields heavy crops of large, wrinkled Pods containing three or four Beans each, in which size and quality are equal to the Pole Lima. POLE or RUNNING BEANS

(Stangenbohnen)

These and Bush Limas are less hardy than other Bush Beans, and should be planted several weeks later, when the ground is warmer. Plant the seeds in slightly raised hills, 5 to 6 feet apart, four or five seeds to a hill. The Limas are especially tender, and the rule for late outside planting with them is rigid. Painstaking cultivators who are usually the most successful, plant them eye downward, after setting stout poles for every hill. All sorts of late-ripening Pole Beans are benefited by pinching the tips of the vines back when they are about 5 feet high. Lima Beans are considered by many the very finest of all Beans, and there is nothing in the vegetable line that can take their place. A quart of Limas will plant about 100 hills; a quart of smaller sorts about 200.

POLE LIMA BEANS (All Best Grade, Hand-Picked)

KING OF THE GARDEN. The vines set Beans early and bear until frost; allow only two vines to a hill. Grows very strongly and is very prolific. Pkt. 10 cts., pt. 15 cts., qt. 30 cts., 1/2 pk. $1.10, pk. $2.10.

SIEBERT'S EARLY LIMA. Pods and Beans quite large; very early and productive; the Beans are very tender and of fine flavor. Pkt. 10 cts., pt. 15 cts., qt. 30 cts., 1/2 pk. $1.10, pk. $2.10.

**PEAS**

(Grünen)

All smooth-seeded Peas may be planted as early in the spring as the soil can be prepared for them, being very hardy. Sow for the first crop as early as practicable, and for succession at intervals of about two weeks until June. Late sowings, however, do not yield so well as early ones. Sow in drills about 2 to 3 inches deep, and from 2 to 4 feet apart, according to the variety, taller sorts requiring more room than dwarf ones. Dwarf Peas require a very rich soil, while taller ones thrive best in rather thin ground. The latter are frequently sown in double rows, with the brush, or support of some kind, between them. wrinkled Peas are not so hardy as the smooth sorts, and should not be sown quite so early, but are superior to them in quality, more delicate in flavor, and remain longer in season. One quart of seed will plant about 100 feet of drill.

Wrinkled varieties are marked with a star (*)

To the end that our customers may have the advantage of professional advice in the planting and care of their vegetables, we have prepared a pamphlet on vegetable-culture which will be sent free on request.
CORN, Sweet or Sugar (Zea mays)

This delicious vegetable may be enjoyed from early summer until frost, if the proper varieties are selected and planted for succession at intervals of every two weeks until the middle of July. If the seed is planted too early, before the ground becomes warm, it is liable to decay. Plant in hills 3 to 4 feet apart each way, five or six kernels to a hill; or in rows 4 to 5 feet apart, scattering the seeds thinly in the rows. The taller growing the variety, the richer should be the soil and the wider the space allowed for development. One quart will plant 200 hills.

ASPARAGUS (Epar格尔)

A bed once properly made and planted will last for years. Plenty of fertilizer should be well trenched in to a depth of 2 feet or more. The roots should be planted as early in the spring as the ground can be prepared, setting them a foot apart in rows 2, 2½ or 3 feet apart. The crowns from 4 to 6 inches below the surface of the bed. Asparagus seed may be sown directly in the permanent bed, and the plants thinned as they grow; or it may be sown elsewhere, and the seedlings transplanted the second year. An ounce of seed will sow 50 feet of drill, and produce about 300 plants. Fair crops may be expected the third year from seed.

ASPARAGUS ROOTS. By planting Asparagus Roots instead of the seeds, much time can be saved in getting the shoots ready for table or market. Plant in spring, as early as possible. See Vegetable Plants, page 22.

BEST GARDEN BEETS

(Salat-riben)

The soil best suited for the Beet is a deep, light and rich, friable loam. For very early crops, the seed is sown in hotbeds, and the seedlings are transplanted to the open ground. For main crop, the seed is sown outside as soon as the soil is in good condition, in drills from 12 to 15 inches apart, and covered about an inch deep; the plants are thinned to stand 4 or 5 inches apart in rows. For winter crops, sow in June, in drills, as for early Beets. An ounce will sow 50 feet of drill, live to six pounds to an acre.

CABBAGE (Brassica oleracea)

Seed sown in hotbed or greenhouse about February 15 will give plants large enough to transplant into hotbeds about March 10. Set them 2 to 3 inches apart each way, and as soon as they become well established, remove the glass for part of the day, to harden them for final transplanting into the open ground, increasing the exposure daily until April 10 to 20, when the final transplanting may be made. For late crops, sow the seed in April or May and transplant to the open ground when large enough, setting the plants up to the first leaf, and 2 x 3 feet apart. It is important that the plants should not stand thick in the seed-beds, as this would induce weak, slender plants. The insects which molest them should be kept in check with remedies which seem most efficacious in the locality. Crops of Cabbage should not be grown on the same ground for a number of years on account of the tendency to club-root.

CARROTS (Wüten)

Carrots succeed best on heavy loam, which preferably should have been well fertilized the previous year, as fresh manure often causes the roots to grow pronged and misshapen. CAULIFLOWER (Blumenkohl)

How to Grow Fine Cauliflower. Culture for Cauliflower and cabbage is essentially the same, but to the former extra care in giving the fertilizers and moisture well repays the gardener. Sow the seeds for early and late crops as directed for cabbage, but do not set the early plants in the open field too soon, for if too much stunted by severe frosts, they begin to form heads before they are strong enough to develop them well. Plants which have not headed before winter sets in may be stored in a cool cellar or cold frame, and will form heads without further attention. An ounce of seed will produce about 1,300 plants.

BECKERT'S EARLY SNOWBALL. Produces large, handsome white heads, 8 to 10 inches across; close, compact and of the finest quality; stalks short, of compact growth; can be planted closely; extra early, a certain variety; cannot be good for a late crop. CELERY (Celtuce)

Celery can be grown in any garden soil, but the finest is produced in deep, mellow bottom land. Seed for early crops should be sown in hotbeds about March 15. The plants may be either thinned to give them room to grow, or transplanted to another bed to grow until it is time to plant them in the open ground. For main crop, seed should be sown in the open air as soon as the soil and air are warm enough. They should be covered lightly, or merely pressed into the earth with a board, if the soil is fine and mellow. The seed-bed must be kept free from weeds, and well watered in dry weather. When the plants are large enough, transplant them to shallow trenches or furrows, from 4 to 6 feet apart, according to the variety grown, setting the plants 6 inches apart in the rows and pressing the soil firmly around them. Blanching consists of drawing earth up to the stalks at intervals of about two weeks, until all but the tops of the plants are covered. Celery may be kept for winter use in pots or cellars, or in deep, narrow trenches, in a dry situation; the latter must be covered with boards, with sufficient soil and manure on top to keep out the frost, leaving openings at short distances for ventilation in mild weather. An ounce of seed will produce about 2,000 plants.

WHITE PLUME. Easily blanched, and one of the very handsomest sorts grown. In large plants the stalks, hearts and inner leaves become white without any blanching. Pkts. 5 cts. and 10 cts., oz. 30 cts., 1/4 lb. 90 cts., lb. $3.25.

**CUCUMBERS**

The seed should not be planted in the open ground before the weather has become warm and settled, and the ground mellow and light. Plant the seeds in well-enriched hills about 4 feet apart each way, and, as soon as all danger from insects is over, thin the plants to leave four of the strongest in each hill. For succession, sow at intervals of every two weeks until midsummer. Extra-early crops are grown by planting the seed in hotbeds in April, upon pieces of sod turned upside down, and removing them to hills in open ground as soon as the weather is warm enough. For pickles, sow seed from the middle of June until the middle of July. The vines bear longer if the fruits are gathered as soon as they are large enough; their strength is soon exhausted by ripening fruits. An ounce of seed will plant 100 hills; two pounds will plant an acre.

For plants to force in hotbeds from November until spring, sow seed in hotbeds in the fall, and cover up as winter approaches, until the plants are required for use. MUSKMELONS (Musc Melonen)

Muskmelon seed should not be planted outdoors until the ground has become warm and dry. The hills should be 6 feet apart, and carefully prepared. Rich earth is far better for the young plants than manure, but, if the latter must be used, see that it is well rotted. Plant from six to twelve seeds in a hill, and when the young seedlings are strong enough to resist the attacks of insects, thin them leaving three of the strongest in each hill. An ounce of seed will plant about 100 hills.

ONION SEED AND ONION SETS

Onions thrive best on a rich, deep, loamy soil. For sets, the seed should be sown very thickly in drills as early as possible in spring. In summer, as soon as the tops die down, harvest the bulbs and store them in a dry, cool place, spreading them in thin layers. Early in the following spring, replant them 4 inches apart, in small drills 12 inches apart, and they will form into fine, large bulbs early in the season. Large Onions may also be grown from seed the first season if the land is strong and well manured, the seed sown thinly in drills a foot apart, and the seedlings thinned to stand 3 or 4 inches apart in the drills; they must be well cultivated and kept free from weeds. Five pounds to the acre will be required for large Onions; for sets, 60 pounds.

Explanation of Abbreviations Used in the Descriptions

HARDY ANNUALS, HA. These should be sown outside in April or May, according to season, latitude and condition of soil; or, they may be sown at a somewhat earlier date in a hothed or greenhouse, the combining of the two methods being advisable, thereby providing for a succession of plantings if both sowings prosper. Seed sown under glass will also produce earlier-blooming plants than seed sown outdoors. The soil should be rather light and rich, and for outdoor sowing it must be thoroughly dug up, well raked and leveled. The coarser seeds are to be covered to once or twice their thickness, while very fine seeds are to be merely pressed into the soil. All sowing should be made with a board or the hand, as this hastens the germination of the seed as well as promoting its regularity. For indoor sowing, use shallow boxes of several inches in depth, and of a size to suit. Careful attention is required as soon as the seed is sown that seedlings may not suffer for lack of moisture, and of air if grown indoors.

HALF-HARDY ANNUALS, HHA, HALF-HARDY BIENNIALS, HBB, and HALF-HARDY PERENNIALS, HHP. These may be sown indoors, as above directed, from March to May, and outdoors after the middle of May. Many of the Biennials and Perennials will bloom the first season if sown early.

HARDY BIENNIALS, HB, and HARDY PERENNIALS, HP, can be sown outdoors as soon as the soil is in good tillable condition. If sown early indoors many of them will bloom the first season. Sowings made from July to September will produce well-established plants for the next season. These should be somewhat protected during the winter. Many seeds of Hardy Biennials and Hardy Perennials are of very slow germination, and seeds of such should not be condemned as bad if a quick germination does not show.

TENDER ANNUALS, TA, TENDER BIENNIALS, TB, and TENDER PERENNIALS, TP, can be sown in March in the greenhouse or in hotbeds in shallow boxes. Transplant to secure sturdy plants, which can then be planted outdoors after danger of frost is over, about May 15.

HHA, HHB and HHP designate Half-Hardy Annuals, Biennials and Perennials.

HB and HP designate Hardy Biennials and Perennials.

TA and TP designate Tender Annuals and Perennials.

Any species or variety to which no letters are affixed are to be considered as Hardy Annuals.

PANSIES (Heartsease) HP

Pansies, while preferring a light, rich soil and a partially shady, cool and moist situation, producing, under such ideal conditions, large, magnificently colored flowers, will nevertheless thrive, under less favorable surroundings. In fact, almost any soil and situation will give good returns. If planted in full sun exposure, much beds during the hot term and water freely; the delicate tints may be partially neutralized, and flowers will not attain full size, yet a very rich and continuous display may be had which in fall will almost equal the early spring show. Faded flowers must be removed every few days to prevent seeding. Seed may be sown from July to September, and these plants, protected over winter, will flower early in spring and continue throughout the season. Spring-sown seed will flower from summer to fall. We offer a very complete collection of varieties and strains embracing "All That's Good in Pansies."

PETUNIA HHA

Hybridizing has accomplished wonders in this as in other genera of plants. But a few years back it was deemed imperative to secure in full stock plants of all desirable varieties. At the present day this would be a waste of time and space, as the excellent strains of seed now offered fulfill all wants. Single- and double-flowering, plain or fringed petals, tall or dwarf growth, may all be had remarkably true from seed, and with these go a degree of vigor that is lacking in plants propagated by cuttins. Petunias are valuable as pot-plants, particularly adapted for vases, baskets, window-boxes, etc., and the dwarf varieties are leaders for bedding. For the latter purpose February and March sowings will be timely. We offer in the following list only the best strains.

SWEET PEAS

Improved varieties are coming thick and fast, and many old favorites must of necessity be dropped from the list. Many of the Spencer's are very grand Sweet Peas; they are uniform in character and not so productive as the older varieties. Their size and form, however, render them very attractive and effective. Our stock is grown for us under most favorable conditions, and will be found true to name and of excellent quality. The seeds should be sown early in spring; or, when the ground is not readily prepared in spring, fall sowing may be made, excepting the white-seeded varieties, which should not be sown until the soil becomes quite warm and dry; or they may be started early in pots in greenhouse or frame and planted out as early as the weather permits. White-seeded varieties, which are the tenderest than the dark-seeded, should be sown in sand to germinate and then transplanted in soil.

LAWN GRASS SEED.
If you desire a perfect lawn, use our Evergreen Lawn Seed. FOR SHADY PLACES, sow our Shady Nook Lawn Seed. Both kinds, if sown early in the spring, will produce a good lawn by midsummer.

ANYWEIGHT LAWN ROLLER
Built with a hollow steel drum with the feature of a rounded edge, a construction which overcomes any marking or turf-cutting. Entrance for the water or sand for weighting is provided by a 1/4-inch opening of threaded bronze. This bronze opening eliminates the bad feature of rusting of the threads which is so common in some other makers. We have added to our list this season No. 1420, a Roller which is bound to be popular with the owners of small city lawns, etc. To weight Rollers, turn on end, remove the plug, clean, and insert nozzle of hose or use a pail and fill the drum to any desired weight, and Roller is ready for use.

Simplicity Combined Hatcher and Brooder

The best thing on the market in the way of a Hatcher. Easiest and simplest of all to operate. No extra expense for a brooder after the chicks are hatched. These Hatchers are made of galvanized iron and copper. Copper is really the only material to use in an incubator, costs only $1 more than the iron, lasts indefinitely. The heat-conducting property of copper is several times greater than that of iron or steel, and the saving in fuel alone will in a short time more than cover the difference in cost. Send for complete descriptive circular. 50-egg Simplicity, with 14-oz. copper heater and tank $8.50 100-egg Simplicity, with 1/24 oz. copper heater and tank $12.00

For a Fine Lawn Use Our Evergreen Lawn Seed

Good soil and proper drainage are absolutely necessary to produce a good lawn. There should be no less than a foot of good surface or sandy soil,—heavy loam where possible. In light or sandy soil the grass has a tendency to burn out in hot, dry weather. Where it is necessary to grade the surface, the subsoil should be removed and replaced with good earth.

If the soil is sufficiently rich, apply a liberal quantity of well-rotted manure; dig or plow this in and incorporate with the soil. Rake or harrow the surface even, and after sowing the seed rake again lightly and firm the soil with a lawn-roller. Never attempt to dig, rake or roll a lawn when the ground is wet.

The best time to make a lawn is early in spring as soon as the ground is in good tillable condition, although very satisfactory results are obtained from lawns made during the summer and autumn.

When the young grass is from 3 to 4 inches high, it should be mown, but not too short, as close cropping is injurious to a new lawn. Repeat the mowing at intervals of about ten days. After the lawn is once well established, frequent rollings are beneficial, especially early in spring, after the soil and with it the roots of the grass have been drawn up by the winter's frost.

On banks and terraces where the seed is liable to be washed off by rains before it has sprouted, a quick catch can be secured by mixing the seed with moist earth about one week before sowing; at the expiration of that time much of the seed is ready to sprout.

BECKERT'S EVERGREEN LAWN

Good seed is as necessary to make a lawn as the proper preparation of the ground. We have made many experiments to determine the grasses best adapted for lawn purposes, and the above mixture is composed of a combination, in proper proportions, of the best natural lawn grasses, so as to produce a continuous good lawn from early spring throughout the summer until late in fall.

The ingredients of this mixture are the highest grade of reclaimed seeds only. This Lawn Seed is sold by the standard bushel of 32 quarts (dry measure) and weighs 24 pounds to the bushel. Lawn Seeds are generally sold on a basis of 14 pounds to the bushel, which will invariably fall one-third or more short of actual measure if composed of choice clean seeds, and where a bushel of 14 pounds holds out in measure, it must of necessity be largely composed of light, chaffy matter of no value.

Use 1 qt. to 300 sq. ft., 4 to 5 bus. to the acre. Qt. 20 cts., postpaid 27 cts.; 2 qts. 35 cts.; 3 qts. 50 cts., 4 qts. 60 cts., pk. $1.15, ½ bus. $2.25, measured bushel of 24 pounds, $4.50, or $2.65 for a bushel of 14 pounds.

PUTTING-GREEN MIXTURE

The very finest, hardy, low-growing grasses are contained in this mixture, producing a close and lasting green turf. Qt. 30 cts., postpaid 37 cts.; pk. $1.75, ½ bus. $3, bus. of 20 lbs. $6.

SHADY-NOOK LAWN MIXTURE

A mixture of grasses best adapted for sowing in shady places where other grasses will not grow. In nearly all lawns where there are trees, there will be found bare, unsightly spots which can be made green and bright by using this mixture. Qt. 25 cts., postpaid 32 cts.; pk. $1.75, ½ bus. $3, measured bus. of 20 lbs. $6.

GOLF-LINKS MIXTURE

Composed of such grasses as will produce a turf suitable for golf-links, cricket-tables or polo-grounds. Qt. 20 cts., postpaid 27 cts.; pk. 90 cts., bus. of 20 lbs. $3.50.

LAWN FERTILIZERS

Stable manure should never be used as a top-dressing on a lawn, as it always contains large quantities of noxious weed seeds.

LAWN AND GARDEN FERTILIZER. Owing to the scarcity of Potash, due to European war conditions, we cannot offer this Fertilizer for the season of 1916.

BONE MEAL, PURE RAW NO. 1. Highest grade. Contains nothing but pure, raw animal bone. Vastly superior to steamed bone. Ammonia 41½ to 6 per cent, phosphoric acid 22 to 24 per cent, equal to bone phosphate 48 to 52 per cent. 5 lbs. 25 cts., 10 lbs. 40 cts., 25 lbs. 75 cts., 50 lbs. $1.25, 100 lbs. $2.10, 200 lbs. $3.90, 500 lbs. $9, 1,000 lbs. $17.50, ton $34.

CANADIAN UNLEACHED HARDWOOD ASHES. Unequaled as a fertilizer for lawns. Acts as a stimulant and supplies natural plant-food, permanently enriching the soil. Apply in fall or early in spring, so that the rain may carry the elements down to the roots of the grasses, producing a rapid and rich green growth. Apply 1,500 to 2,000 lbs. to the acre. Not sold in less quantity than a barrel of 200 lbs. Bbl., 200 lbs. $2.75, 1,000 lbs. $11.50, ton $21.

SHEEP MANURE, PULVERIZED. A most excellent stimulant, promoting a strong, healthy and rapid growth. 2 lbs. 10 cts., 5 lbs. 20 cts., 10 lbs. 35 cts., 25 lbs. 75 cts., 100 lbs. $2, 500 lbs. $9, 1,000 lbs. $16, ton $30.
